Lab 3: Consuming External Service – ChatGPT

Name: ZHAO Zhan
Student ID: 25482351
GitHub: @Extious

March 8, 2026

1. Architecture of the Chatbot System

The chatbot system consists of the following components:

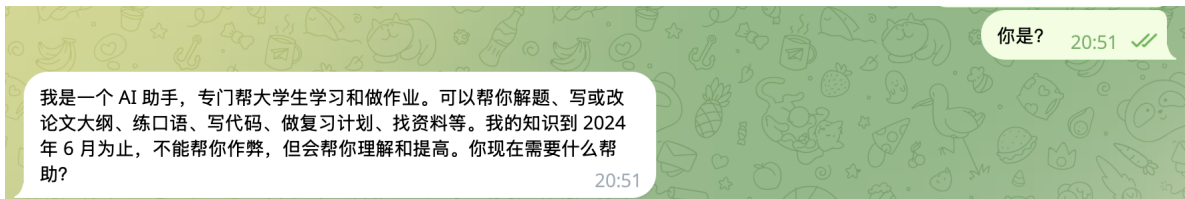

- **Telegram Bot Client:** Runs on the user's local machine (or server). It uses `python-telegram-bot` [3, 4] to connect to Telegram's API and receive/send messages via long polling.
- **chatbot.py:** The main entry point running locally. It loads `config.ini`, creates a `ChatGPT` client, registers message handlers, and starts polling.
- **ChatGPT_HKBU.py:** A local Python module that wraps the HKBU ChatGPT REST API. It reads API configuration from `config.ini` and sends HTTP POST requests to the HKBU GenAI endpoint.
- **HKBU GenAI API** (<https://genai.hkbu.edu.hk/api/v0/rest>): A remote cloud service hosted by HKBU [1,2]. It receives chat completion requests and returns LLM-generated responses.

Where components run:

- Local: `chatbot.py`, `ChatGPT_HKBU.py`, `config.ini`
- Remote: Telegram servers (message delivery), HKBU GenAI API (LLM inference)

2. Screenshots of Telegram Bot with ChatGPT

Here are some screenshots of the Telegram bot with ChatGPT.

What is SNP? 20:51 ✓

Do you mean SNP in genetics or the Scottish National Party? I'll explain the genetics meaning first, since that's the most common usage in university science classes — tell me if you meant the party instead.

SNP (single nucleotide polymorphism) — simple explanation:

- It's a change of a single DNA base (A, T, C, or G) at a specific position in the genome.
- Example: most people might have an A at position X, while some have a G there — that single-base difference is an SNP.
- By convention, something is called an SNP if the less common version (the minor allele) appears in at least about 1% of the population.

Key points:

- SNPs are the most common form of genetic variation in humans — roughly one SNP every 1,000 bases.
- They can be in coding regions (genes), noncoding regions (between genes), or regulatory regions (promoters/enhancers).
- Effects:
 - No effect (synonymous change or in nonfunctional DNA).
 - Change the protein sequence (nonsynonymous) and possibly change function.
 - Affect gene regulation (how much or when a gene is expressed).
- Genotypes: people can be homozygous (same allele on both chromosomes) or heterozygous (two different alleles).
- Uses in research and medicine:
 - Genome-wide association studies (GWAS) to find SNPs linked to diseases or traits.
 - Population genetics and ancestry analysis.
 - Pharmacogenomics (how people respond to drugs).
 - Forensics and genetic fingerprinting.

How they're detected:

- Genotyping arrays (chips) that test many known SNPs at once.
- DNA sequencing (whole-genome or targeted) which can discover new SNPs.

Databases and naming:

- Public databases like dbSNP catalog known SNPs; common IDs look like "rs123456".

If you meant the political SNP (Scottish National Party) I can give a short summary of that instead. Which one did you want?

20:51 ❤️

3. Terminal Logs

Here are the logs from running `python chatbot.py`:

```
(comp7940-lab) zhaozhan@zhaozhan-macbookair lab3 % export HTTPS_PROXY=http://127.0.0.1:7897
python chatbot.py
